

#### Healthy Teeth

These teeth are perfectly healthy teeth. There is no decay and no old fillings in need of replacement.

## Bridges are hard to Clean and Maintain

#### Food Trap

Food gets caught under a bridge very easily. It is very difficult to properly clean a bridge. Dental floss can be guided between the teeth, but it is difficult.

# Implants duplicate Natural Teeth

#### Significant Drilling of Teeth

Each one of these otherwise healthy teeth must be drilled upn to accept the crowns that will act as the anchors for the bridge.

#### Decay is Possible

If the bridge is not properly cleaned, decay under the crowns is highly likely. This will cause the bridge to fail and require that it be redone.

Significant decay might necessitate the extraction of one, or possibly both, of the supporting teeth.

### No Drilling

An implant is placed directly into the jawbone. It creates a firm anchor for a replacement tooth without the need to drill on the adjacent teeth.

#### Benefits of a Dental Implant

- Cleans easily
- No drilling on teeth
- Maintains bone shape
- Lasts longer
- Feels like natural tooth
